

CS4234 Optimisation Algorithms

Notes

AY2024/25 Semester 1 • Prepared by Tian Xiao @snoidetx

Problems	Deterministic	Randomized	LP + Rounding
Vertex Cover	<p>Two special cases: ① Vertex cover on a tree; ② Known upper bound k.</p> <p><u>Deterministic Vertex Cover (2-approximation)</u> Repeat until no remaining edge: ① Pick a random edge (u, v); ② Add both u and v to vertex cover; $G \rightarrow G - u - v$.</p>	<p><u>Randomized Vertex Cover (2-approximation)</u> Repeat until no remaining edge: ① Pick a random edge (u, v); ② Let $z = u$ or v w.p. $\frac{1}{2}$; ③ Add z to vertex cover; $G \rightarrow G - z$.</p>	<p>For weighted vertex cover: $\min \sum_{v \in V} w_v x_v$ s.t. $x_u + x_v \geq 1, \forall (u, v) \in E$ $x_v \in \{0, 1\}, \forall v \in V$. <u>relax</u> $[0, 1]$ Rounding: If $x_v \geq \frac{1}{2}$, add v to vertex cover. (2-approximation)</p>
Set Cover	<p><u>Greedy Set Cover (O(log n)-approximation)</u> Repeat until all elements are covered: ① Choose the set S_j that covers the most uncovered elements; ② $X \rightarrow X \setminus S_j$.</p>	<p><u>Linear Programming</u> $\max c^T x$ n variables s.t. $Ax \geq b$ m constraints. $x \geq 0$</p> <p><u>Simplex Method (O(m^n))</u> ① Find any feasible vertex v. ② $v_1, \dots, v_k \leftarrow$ neighbors of v. ③ Calculate $f(v)$ and $f(v_1) \dots f(v_k)$. If s.t. $A^T x \leq b; x \geq 0$. $f(v)$ is the max, stop and return $f(v)$. ④ Otherwise, choose one neighbor v_j s.t. $f(v_j) > f(v)$. Set $v = v_j$. ⑤ Return to step ③.</p> <p><u>Farkas's Lemma / LP Duality</u> If $Ax \geq b$ has no solution, then $\exists \lambda \geq 0 \in \mathbb{R}^m$ s.t. $\lambda^T A x = 0$ and $\lambda^T b = 1$.</p>	<p>Feasibility is in NP (co-NP) ① No solution $\Rightarrow \exists$ polynomial λ ② A solution exists $\Rightarrow \exists$ polynomial solution.</p> <p><u>Ellipsoid Method (polynomial time)</u> $b - \epsilon \leq Ax \leq b + \epsilon$, where $\epsilon \in \frac{1}{2^{\text{padding}}}$</p> <p><u>LP Duality</u> \Rightarrow if both finite optimum exists $\max c^T x = \min b^T y$ s.t. $A^T y \geq c; y \geq 0$.</p> <p><u>Maximum Bipartite Matching</u> $\max \sum_{(u,v) \in E} x_{uv} w_{uv}$ s.t. $\sum_{u \in U} x_{uv} = 1, \forall v \in V$ $0 \leq x_{uv} \leq 1, \forall (u, v) \in E$. } LP solution = ILP solution</p> <p><u>Semidefinite Programming relaxation</u> Random hyperplane rounding = 0.87856-approximation</p>
Traveling Salesman	<p><u>MST + DFS (for G-R, 2-approximation)</u> ① Construct the complete graph G ② Let T be MST of G. ③ Let C be the cycle by DFS of T. <u>Christofides Algorithm</u> (for M, 1.5-approximation) ① $T \leftarrow$ MST of G. Add T's edges to E. ② Let O be nodes in T with odd degree. O is even. ③ $M \leftarrow$ min cost perfect matching for O. ④ $G \leftarrow (X, E \cup M)$ (multigraph). ⑤ Return Eulerian cycle C for G.</p>	<p><u>Simplex Method (O(m^n))</u> ① Find any feasible vertex v. ② $v_1, \dots, v_k \leftarrow$ neighbors of v. ③ Calculate $f(v)$ and $f(v_1) \dots f(v_k)$. If s.t. $A^T x \leq b; x \geq 0$. $f(v)$ is the max, stop and return $f(v)$. ④ Otherwise, choose one neighbor v_j s.t. $f(v_j) > f(v)$. Set $v = v_j$. ⑤ Return to step ③.</p> <p><u>Farkas's Lemma / LP Duality</u> If $Ax \geq b$ has no solution, then $\exists \lambda \geq 0 \in \mathbb{R}^m$ s.t. $\lambda^T A x = 0$ and $\lambda^T b = 1$.</p>	<p><u>LP Duality</u> \Rightarrow if both finite optimum exists $\max c^T x = \min b^T y$ s.t. $A^T y \geq c; y \geq 0$.</p> <p><u>Maximum Bipartite Matching</u> $\max \sum_{(u,v) \in E} x_{uv} w_{uv}$ s.t. $\sum_{u \in U} x_{uv} = 1, \forall v \in V$ $0 \leq x_{uv} \leq 1, \forall (u, v) \in E$. } LP solution = ILP solution</p> <p><u>Semidefinite Programming relaxation</u> Random hyperplane rounding = 0.87856-approximation</p>
CNF-SAT	<p><u>Greedy CNF-SAT</u> $(1 - \frac{1}{2^k})$-approximation for k-CNF-SAT; $\frac{\sqrt{5}-1}{2}$-approximation for general CNF-SAT) For each x_i, choose $\arg \max_{x_i \in \{0,1\}} E[W^* x_1, \dots, x_i]$.</p>	<p><u>Randomized Weighted k-CNF-SAT</u> $(1 - \frac{1}{2^k})$-approximation) For each x_i, let $x_i = 1$ or 0 w.p. $\frac{1}{2}$.</p> <p><u>Randomized Weighted CNF-SAT</u> $(\frac{\sqrt{5}-1}{2})$-approximation) For each x_i, let $x_i = 1$ w.p. $p = \frac{\sqrt{5}-1}{2}$.</p>	<p><u>LP Duality</u> \Rightarrow if both finite optimum exists $\max c^T x = \min b^T y$ s.t. $A^T y \geq c; y \geq 0$.</p> <p><u>Maximum Bipartite Matching</u> $\max \sum_{(u,v) \in E} x_{uv} w_{uv}$ s.t. $\sum_{u \in U} x_{uv} = 1, \forall v \in V$ $0 \leq x_{uv} \leq 1, \forall (u, v) \in E$. } LP solution = ILP solution</p> <p><u>Semidefinite Programming relaxation</u> Random hyperplane rounding = 0.87856-approximation</p>
CSP-SAT	<p><u>Lovász Local Lemma</u> Let ϕ be a CSP. If $\exists \mu_c \in (0, 1)$ for all $c \in \phi$ s.t. $\forall C \in \phi, w(C) \leq \mu_c \prod_{c \in T_C(C)} (1 - \mu_c)$, then ϕ is satisfiable.</p>	<p><u>Moser's Algorithm</u> ($\sum_c \frac{\mu_c}{1 - \mu_c}$ iterations) ① Randomly assign values to all variables ② While \exists unsatisfied constraint C_j: Randomly assign values to all variables in C_j.</p>	<p><u>LP Duality</u> \Rightarrow if both finite optimum exists $\max c^T x = \min b^T y$ s.t. $A^T y \geq c; y \geq 0$.</p> <p><u>Maximum Bipartite Matching</u> $\max \sum_{(u,v) \in E} x_{uv} w_{uv}$ s.t. $\sum_{u \in U} x_{uv} = 1, \forall v \in V$ $0 \leq x_{uv} \leq 1, \forall (u, v) \in E$. } LP solution = ILP solution</p> <p><u>Semidefinite Programming relaxation</u> Random hyperplane rounding = 0.87856-approximation</p>
Network Flow	<p><u>MFMC Theorem</u> Let $G = (V, E)$ with capacity c be a flow network, and fix any $s, t \in V$. There exists a feasible flow f and a cut (S, T) on G s.t. f saturates every edge from S to T and avoids any edge from T to S, with $f = S, T$.</p> <p><u>Ford-Fulkerson Algorithm</u> $O(E f)$ ① Let $f(u \rightarrow v) \leftarrow 0, \forall u \rightarrow v \in E$ ② While s can reach t in G_f: (a) Use BFS or DFS to find an augmenting path P from s to t in G_f. (b) $F \leftarrow \min_{u \rightarrow v \in P} c_f(u \rightarrow v)$ (c) For all $u \rightarrow v \in P$, update its flow value: i. $f(u \rightarrow v) \leftarrow f(u \rightarrow v) + F$. ii. $f(v \rightarrow u) \leftarrow f(v \rightarrow u) - F$. ③ Return f.</p> <p>Application: ① Edge-disjoint paths ② Vertex capacities ③ Bipartite matching ④ Disjoint path cover of acyclic directed graphs ⑤ Minimising the teaching staff.</p>	<p><u>Flow-Decomposition Theorem</u> Every non-negative (s,t)-flow can be written as a tve linear combination of directed (s,t) path flows and directed cycle flows. An edge appears in a flow iff the amount of flow through the edge is tve. #paths + #cycles $\leq E$.</p> <p><u>Edmonds-Karp Fat Pipes Algorithm</u> $O(E ^2 \log V \log f^*)$ ① Let $f(u \rightarrow v) \leftarrow 0, \forall u \rightarrow v \in E$ ② While s can reach t in G_f: (a) Use Dijkstra's algorithm to obtain an augmenting path P from s to t in G_f, with the largest bottleneck value F. (b) For all $u \rightarrow v \in P$, update its flow value: i. $f(u \rightarrow v) \leftarrow f(u \rightarrow v) + F$. ii. $f(v \rightarrow u) \leftarrow f(v \rightarrow u) - F$. ③ Return f.</p>	<p><u>LP Duality</u> \Rightarrow if both finite optimum exists $\max c^T x = \min b^T y$ s.t. $A^T y \geq c; y \geq 0$.</p> <p><u>Maximum Bipartite Matching</u> $\max \sum_{(u,v) \in E} x_{uv} w_{uv}$ s.t. $\sum_{u \in U} x_{uv} = 1, \forall v \in V$ $0 \leq x_{uv} \leq 1, \forall (u, v) \in E$. } LP solution = ILP solution</p> <p><u>Semidefinite Programming relaxation</u> Random hyperplane rounding = 0.87856-approximation</p>
